

Bridging AI Solution Development Programme

Weekly Report

Date: 07/01/2026 – 09/01/2026 (Wednesday – Friday)

Overview:

This week, we resumed from where we left off before the break and continued working on loops combined with conditional statements (`if` statements). The focus was on understanding how these structures interact and applying them to different data types.

1. Loops & Conditional Statements

- Practiced using `for` loops in combination with `if` statements.
- Explored how to control flow and make decisions within loops.

2. String Manipulation

- Printed entire strings and individual characters.
- Applied transformations such as:
 - Converting to uppercase and lowercase.
 - Slicing strings to extract specific parts.
 - Performing other operations like extracting characters and rearranging them.

3. Integer Manipulation

- Used loops and `if` statements to perform operations on integers.
- Practiced logic for handling numeric data in iterative processes.

4. Challenges

Completed a series of exercises, ranging from simple to tricky.

Step-by-Step Problem Solving: Dev provided clear explanations and demonstrated how to break down complex tasks into smaller, manageable steps.

Learned how breaking problems into pieces helps tackle large, complex tasks effectively.
